

NON-INTERRUPTION LIGHT SOURCE

ABSTRACT OF THE DISCLOSURE

A non-interruption light source includes a base, a casing, a battery, a light source, a shade and a circuit board. The base is connected to the casing that is connected to the shade. A space enclosed by the casing the shade receives the circuit board, the battery and the light source and the circuit board, the battery and the light source are connected with each other by wires. The circuit board transfers alternative current into direct current that is provided to the light source. The circuit board detects whether or not the primary power supply is cut and switches to the power of battery accordingly.
